

**DISSERTATION INTERNSHIP**

**AT**

**INTERNATIONAL INSTITUTE OF HEALTH  
MANAGEMENT AND RESEARCH, NEW DELHI**

**“TO ESTIMATE THE PREVALENCE OF OBESITY AND  
HYPERTENSION AMONG ADULTS LIVING IN URBAN  
SLUMS IN DELHI: A CROSS- SECTIONAL STUDY”**

**BY**

***Dr. MANIKA KHAJURIA***

***PG/20-22/108***

**UNDER THE GUIDANCE OF**

***Dr. SUMANT SWAIN***

**PGDM (Hospital & Health Management)**

**2020-22**

**International Institute of Health Management  
And Research, New Delhi**

## **Certificate of Dissertation Completion**

The certificate is awarded to

**Dr. Manika Khajuria**

in recognition of having successfully completed her  
Internship in the department of

**PUBLIC HEALTH**

and has successfully completed her Project on

**TO ESTIMATE THE PREVALENCE OF OBESITY AND  
HYPERTENSION AMONG ADULTS LIVING IN URBAN SLUMS IN  
DELHI: A CROSS-SECTIONAL STUDY**

**AT**

**INTERNATIONAL INSTITUTE OF HEALTH  
MANAGEMENT AND RESEARCH, NEW DELHI**

She comes across as a committed, sincere & diligent person who has a strong  
drive & zeal for learning.

We wish her all the best in future endeavors.

Certificate of Approval

  
**Training & Development**

  
**Zonal Head-Human Resources**

## TO WHOMSOEVER IT MAY CONCERN

This is to certify that **Dr. Manika Khajuria** student of PGDM (Hospital & Health Management) from the International Institute of Health Management Research, New Delhi has undergone internship training at **IIHMR, Delhi** from **1<sup>st</sup> April to 30 June 2022**.

The Candidate has successfully carried out the study designated to her during internship training and her approach to the study has been sincere, scientific and analytical.

The Internship is in fulfillment of the course requirements.

I wish her all success in all her future endeavors.

Dr. Sumesh Kumar  
Associate Dean, Academic and Student Affairs  
IIHMR, New Delhi

Dr. Sumant Swain  
(Assistant Professor  
IIHMR, New Delhi)

## Certificate of Approval

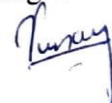

The following dissertation titled **"To estimate the prevalence of hypertension and obesity among adults living in urban slums in Delhi : A cross-sectional study"** at

**"IIHMR Delhi"** is hereby approved as a certified study in management carried out and presented in a manner satisfactorily to warrant its acceptance as a prerequisite for the award of **PGDM (Hospital & Health Management)** for which it has been submitted. It is understood that by this approval the undersigned do not necessarily endorse or approve any statement made, opinion expressed or conclusion drawn therein but approve the dissertation only for the purpose it is submitted. Dissertation Examination Committee for evaluation of dissertation.

Name

Dr. Dharmesh Lal  
Vinita  
Rohini

## **Certificate from Dissertation Advisory Committee**

This is to certify that **Dr. Manika Khajuria**, a graduate student of the **PGDM (Hospital & Health Management)** has worked under our guidance and supervision. She is submitting this dissertation titled **"TO ESTIMATE THE PREVALENCE OF OBESITY AND HYPERTENSION AMONG ADULTS LIVING IN URBAN SLUM IN DELHI: A CROSS-SECTIONAL STUDY"** at **"IIHMR, Delhi"** in partial fulfilment of the requirements for the award of the **PGDM (Hospital & Health Management)**.

This dissertation has the requisite standard and to the best of our knowledge, no part of it has been reproduced from any other dissertation, monograph, report or book.

Dr. B.S Singh  
Associate Professor  
IIHMR, New Delhi

Dr. Sumant Swain  
Assistant Professor  
IIHMR, New Delhi

**INTERNATIONAL INSTITUTE OF HEALTH MANAGEMENT RESEARCH,  
NEW DELHI**

**CERTIFICATE BY SCHOLAR**

This is to certify that the dissertation titled **"To Estimate the Prevalence of Obesity and Hypertension among adults living in an urban slum in Delhi: A Cross sectional study"** and submitted by **Dr. Manika Khajuria**, Enrollment No. **PG/20-22/108** under the supervision of Dr.sumant swain for the ward of PGDM (Hospital & Health Management) of the Institute carried out during the period from 1<sup>st</sup> April to 330 June 2022 embodies my original work and has not formed the basis for the award of any degree, diploma associate ship, fellowship, titles in this or any other Institute or other similar institution of higher learning.

## **Acknowledgement**

First and foremost, praises and thanks to the God, the Almighty for his showers of blessings throughout my Dissertation.

The training period is always a great chance for learning and professional development. I would like to express my sincere gratitude to **IIHMR, Delhi** for giving me this opportunity to do my dissertation and project work in their organisation and for sharing generously their valuable insight and precious time which motivated me to do my best during dissertation period.

I am greatly thankful to my project mentors **Dr. B.S Singh, Dr. Pankaj Talreja and Dr. Anandhi Ramachandran** for their utmost guidance and help to complete my dissertation.

Finally, I would like to thank my mentor from IIHMR, Delhi **Dr. Sumant Swain** for his support and encouragement throughout my Dissertation and project work. Without his cooperation and guidance, it would not have been possible to conduct my study and complete my dissertation successfully.

## **OVERVIEW ABOUT THE ORGANIZATION**

The International Institute of Health management Research, New Delhi was setup in the year 2008. The institute mainly provides post graduate programs in health, hospital and information technology in health care and management development programs. The institute also focus on the research projects which help in policy analysis, policy formulation and also help in the implementation of the policies for the health care sectors. It has emerged as a reputed institute for providing good health care management professionals nationally as well as globally. It is an autonomous institute performing well for several years to improve health care by training the students and making them good professionals for future. The institute also made an effort to promote the success for the 17 sustainable Development Goals. The IIHMR is involved in various research projects which act as a support for health policy and planning.

### **MISSION AND VISSION OF IIHMR:**

- **MISSION:** this institution is dedicated in the improvement of standards of health through proper and better management of health care and its programs with the help of management research, training, education and proper networking of the institute at global level
- **VISION:** the main objective and vision of the institute is to give its contribution in health care sector for social equity with the help of its commitment to support health programs for improving healthcare sectors

### **CAPABILITIES AND THRUST AREAS:**

- AICTE approved two-year PGDHM
- Management development programs
- Research projects
- Quality assurance and accreditation
- Insurance related to healthcare
- E-learning

### **CORE ACTIVITIES:**

- Research
- Training

- Teaching

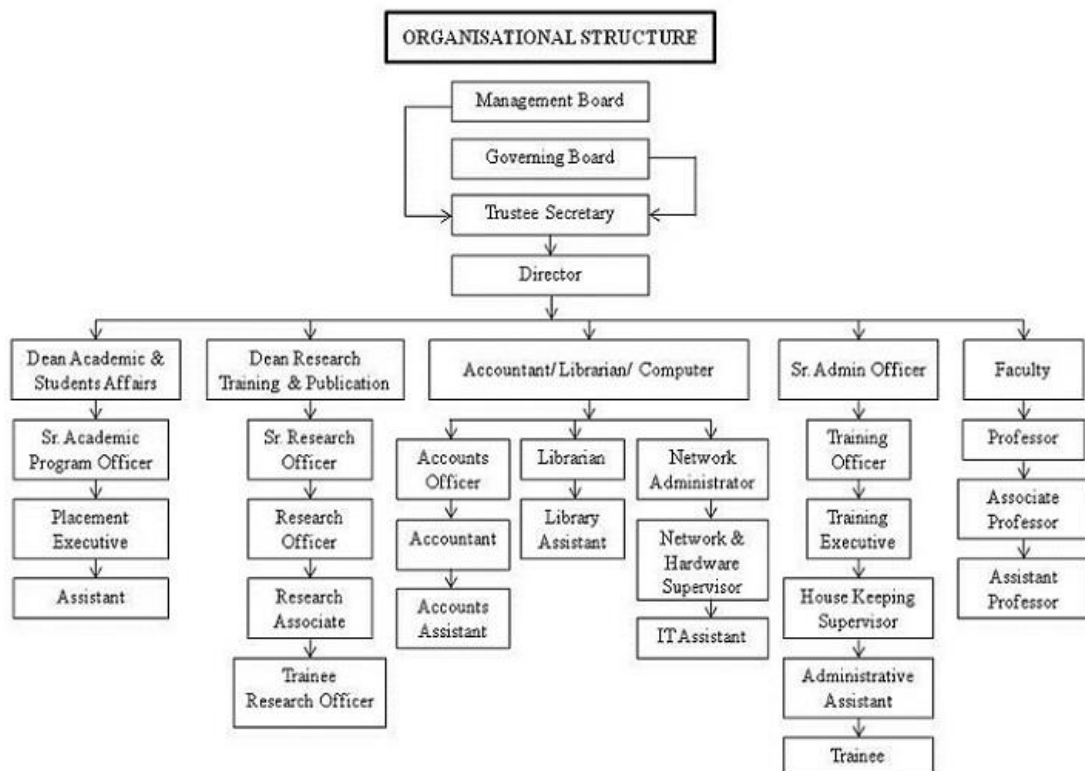

## GLOBAL NETWORKING:

IIHMR, Delhi has collaborations with various reputed institutions and organizations.

Some of them are given below:

- ✓ World Health organization (WHO)
- ✓ South-east Asia Public Education Institution network (SEAPHEIN)
- ✓ National Institute of Health and family Welfare (NIHFW)
- ✓ SAARC Tuberculosis and HIV/AIDS centre (STAC)
- ✓ National Health Systems Resource centre (NHSRC)
- ✓ The union South East Asia (USEA)

## ORGANIZATION STRUCTURE:

## **ABSTRACT**

**INTRODUCTION:** It is a life-threatening disease as it is a major cause of premature deaths globally. The overall prevalence of hypertension in India is 29.8% with higher prevalence in urban parts i.e., 33.8%.

**METHODS:** it was a cross-sectional study conducted in Goyla dairy which is a urban slum in Delhi. Structured questionnaire was formed and face to face interviews were taken. Anthropometric measurements like height and weight were taken to calculate BMI. Blood pressure was taken three times with the time interval of one minute in every reading.

**RESULTS:** the overall prevalence of hypertension was 15.3%. This was more in females (8.7%) as compared to males (6.6%) and this difference was statistically significant ( $p<0.001$ ). The prevalence of hypertension is more in the population comes under 55-64, prevalence of pre-hypertension is more in population comes under 35-44 years and the prevalence of non-hypertensive is more in population comes under 25-34 years. prevalence of overweight and obesity is more in female (33.7%) as compared to male (19.4%) and this difference was statistically significant ( $p<0.001$ ).

**CONCLUSION:** hypertension and obesity are highly prevalent among the adults of urban poor of Delhi in the study. It highlights the rising burden of NCDs like hypertension among urban poor.

## **PROJECT REPORT**

### **TO ESTIMATE THE PREVALENCE OF OBESITY AND HYPERTENSION AMONG ADULTS LIVING IN URBAN SLUM IN DELHI: A CROSS-SECTIONAL STUDY**

#### **BACKGROUND:**

Obesity is one of the serious problems now a days. People in today's world do not understand the value of exercise and healthy food. Obesity has emerged as a bigger health problem and has nearly tripled worldwide since 1975. <sup>[1]</sup> According to the WHO, in 2016, 39% of adults were overweight and 13% of adults of same age group were obese and over 340 million children and adolescent of age group of 5yrs to 19 yrs. were obese. obesity occurs when there is an imbalance of energy between calories consumed, and calories expended which leads to an abnormal or excessive accumulation of fat in the body. The simple index i.e., BMI (body mass index) is used to classify weight. According to WHO, BMI more than or equal to 25 is considered as overweight and BMI more than or equal to 30 is considered as obesity in adults. <sup>[2]</sup> There are various causes of obesity like poor diet, lack of exercise, genetics, and underlying medical conditions.) <sup>[3]</sup>

Hypertension is a condition in which the blood pressure in the arteries is persistently elevated. According to WHO, its silent in 46% of adults as they are unaware of the condition and 42% of the adults know about it and treated and 21% of adults have it under control. It is a life-threatening disease as it is a major cause of premature deaths worldwide. <sup>[4]</sup> Hypertension leads to ischemic heart diseases and stroke which results in estimated 1.6 million deaths annually in India. <sup>[5]</sup> The overall prevalence of hypertension in India is 29.8% with higher prevalence in urban parts i.e., 33.8%. <sup>[6]</sup> The people with obesity are more at risk of getting hypertension comparatively non-obese people. <sup>[7]</sup>

## REVIEW OF LITERATURE:

Avita Rose Johnson et al. (2021) have done a study among adults living in a Bengaluru city of India to find the prevalence of obesity and they have found a high prevalence of obesity and abdominal obesity among them, with three fourth of the population was overweight or obese. <sup>[8]</sup>

Rajeev Ahirwar et al. (2018) have done a study on the prevalence of obesity in India and concluded that the prevalence of obesity varies with factors like gender, age, , socio-economic factors etc and found abdominal obesity as one of the risk factors for cardiovascular diseases. <sup>[9]</sup>

Abdhalah K Ziraba et al. (2009) have studied on overweight and obesity in urban Africa and found that the prevalence of obesity has been increased by almost 35% during the covered period and found the prevalence more in poor population as compared to richer population and also concluded that it might become epidemic in the future. <sup>[10]</sup>

ShammiLuhar et al. (2020) have done a study on the forecasting the prevalence of overweight and obesity in India to 2040 and estimated that the prevalence of overweight will more than double, and prevalence of obesity will triple among Indians aged 20-69 years between 2010-2040. <sup>[11]</sup>

Teferi Mekonnen et al. (2018) in their community based cross sectional study on overweight/obesity among adults in North-western Ethiopia concluded that overweight/obesity is emerged as a public health problem among adults in Ethiopia and the higher odds of being overweight/obese were noted among urban residents, females and older age. <sup>[12]</sup>

Vinod K Ramani et al. (2020) have done a cross-sectional study on the prevalence of hypertension and diabetes morbidity among adults in a few urban slums of Bangalore city, determinants of its risk factors and opportunities for control and they found 21.5% prevalence proportion for hypertension with 32.4% of overweight and 20.0% of obesity among study subjects <sup>[13]</sup>

Suvro Banerjee et al. (2015) have found the overall prevalence of hypertension was 42% which was quite high in their population based cross-sectional study on the prevalence, awareness and control of hypertension which was conducted in the slums of Kolkata, and they concluded that although the awareness of the condition is high but the control of hypertension is poor <sup>[14]</sup>

Abhijit P Pakhare et al. (2021) have done a prospective cohort study to find the incident hypertension in urban slums of central India and found higher incidence with increasing age and more in men and people with prehypertension have increased risk of developing hypertension. <sup>[15]</sup>

Ajeet s Bhadoria et al. have done a cross-sectional study to find the difference among rural and urban population in the terms of prevalence of hypertension and its association with various factors and found the prevalence of hypertension higher in both the communities. <sup>[16]</sup>

Jinyu sun Qu et al. (2022) conducted a cross-sectional survey to examine the association between abdominal obesity and hypertension in normal weight adults and found the positive correlation of waist circumference with hypertension and concluded that the measuring abdominal obesity helps in the Improvement of the evaluation of hypertension and helps in the management of the same. <sup>[17]</sup>

Sung-Hee Lee et al. (2005) conducted a retrospective cohort study on obesity and hypertension risk among Korean adults to find out the level of BMI at which the risk for hypertension increases and they confirmed in their study that obesity is a strong risk factor for hypertension among Korean adults. <sup>[18]</sup>

Miguel Gus et al. (2004) found that obesity a risk for hypertension is better identifiable by measuring waist circumference rather than measuring only BMI in their study done on the association between different measurements of obesity and the incidence of hypertension. <sup>[19]</sup>

Yasin I. Tayem et al. (2012) in their cross-sectional study detected a high prevalence of hypertension and obesity among students at central university in the west bank and prevalence was more in males than females <sup>[20]</sup>

MT Guagnano et al. (2001) conducted a cross-sectional study among outpatients at the obesity research centre and found the strong association between waist circumference and higher blood pressure.<sup>[21]</sup>

Bishav Mohan et al. have done a study in the urban and rural areas of Ludhiana and found out the high prevalence of hypertension and obesity among school going children and adolescents in a northern state in India and found that the hypertension was positively associated with overweight and obesity.<sup>[22]</sup>

Salvi shah et al. (2013) have done a study to assess the association of obesity and hypertension in school going children and found that 8.94% of children were obese and 20.09% were hypertensive and concluded the positive association between them among children and later on both may act as a risk factor for heart diseases.<sup>[23]</sup>

Subhija Praso et al. (2012) have done a study to assess BMI and to find out the correlation of obesity and arterial hypertension.<sup>[24]</sup>

Onoja M. Apka et al. (2020) have done study to find out the patterns of association between obesity and hypertension and found hypertension more in obese people comparatively non-obese persons.<sup>[25]</sup>

## **STUDY OBJECTIVE:**

### ***General objective:***

The study aimed to estimate the prevalence of obesity and hypertension among adult population between age group 15-65 years of age in urban slum in Delhi

### ***Specific objectives:***

- To determine the prevalence of hypertension among adults
- To determine the prevalence of obesity among adults
- To assess the associated factors with obesity and hypertension

## **METHODOLOGY:**

### ***Study Design:***

cross-sectional survey

***Study period:*** the study was conducted from 25<sup>th</sup> march to 5<sup>th</sup> June 2022.

***Study Area:*** Goyla dairy, Delhi

***Study Participants:*** Study population were males and females aged between 15-65years of age.

### ***Eligibility Criteria:***

#### **A. Inclusion criteria:**

- All males and females aged between 15-65 years of age

#### **B. Exclusion Criteria:**

- Pregnant Women
- All participants who were currently undergoing treatment for any disease other than Cardio-vascular disorders

**Sampling Technique:** As per the register of the ASHA of block, there was a total of 278 houses in the selected community. The first house was chosen randomly. Then every alternate house was selected by using systematic random sampling.

**Sample size:** A sample size of 202 was calculated considering a prevalence of hypertension as 32.8% as per NHFS-5 report.

***Study tool and data collection:***

- A structured questionnaire was made on kobo toolbox application. The questionnaire included questions related to socio-demographic details, questions related to related risk factors like alcohol, smoking, tobacco, stress and physical activities.
- Data was collected through house-to-house survey.
- Anthropometric measurements like height, weight was recorded as per the standard guidelines laid down by NFHS-5. Using height and weight, BMI was calculated and subjects were classified into four categories of underweight, normal, overweight and obese.
- Blood pressure was measured three times with the time interval of one minute in each measurement. The average of the last two readings was taken as per the guidelines of the NFHS-5. The systolic Blood pressure equal to more than 140mmHg and diastolic blood pressure of more than 90mmHg was taken as hypertensive as per the guidelines of the WHO.

**Data Analysis:** Data analysis was done using SPSS version 22. Descriptive statistics were applied to calculate frequency and percentage of each variable. Difference between different variables was assessed using the chi square test for their statistical significance and value of p less than 0.05 was considered significant.

**Ethical consideration:** Informed Consent from participants were taken. The study involves no risk and the study did not conduct any intervention/ experiment on human subjects. Anthropometric measurements and Blood pressure measurements were taken after taking the consent from the participants as per the standard guidelines laid down by NFHS-4. The study was submitted for ethical review to the IIHMR student research review board and the tools and protocol were cleared through the committee

## Results:

Table 1 shows the socio-demographic characteristics such as age, gender, education, religion, caste/tribe, occupation and coverage of health insurance. Female population is more which is 44.4% as compared to male population which is 55.6.

| Characteristics       | Number(n=196) | Percentage (%) |
|-----------------------|---------------|----------------|
| <b>Age (in years)</b> |               |                |
| 15-24                 | 25            | 12.8           |
| 25-34                 | 58            | 29.6           |

Figure 1 shows the gender wise prevalence of different stages of hypertension with prevalence of hypertensive stage is more in female (8.7%) compared to male (6.6%), prevalence of pre-hypertensive stage is more in males (26%) compared to female (16.3) and prevalence of non-hypertensive stage is more in females (30.6) as compared to male (11.7%).

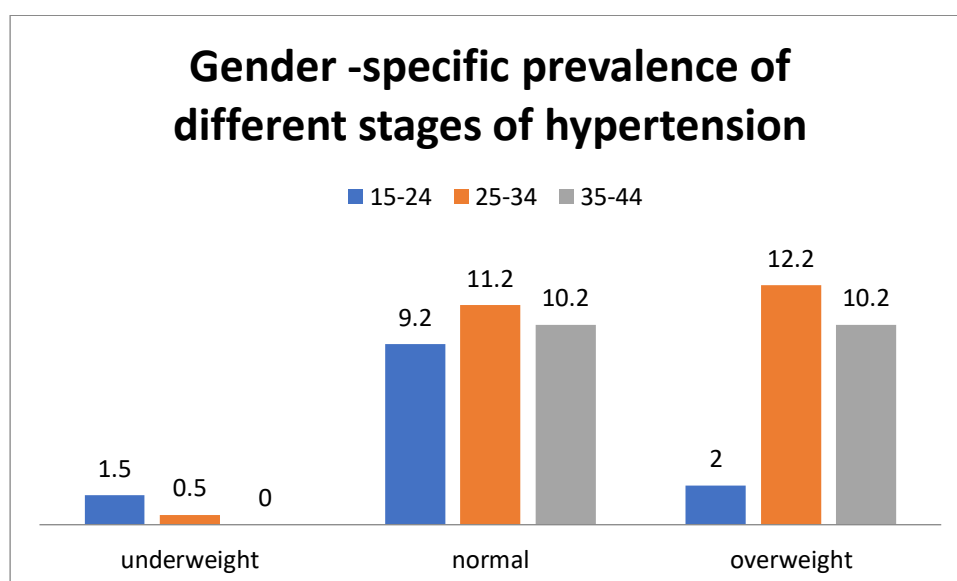

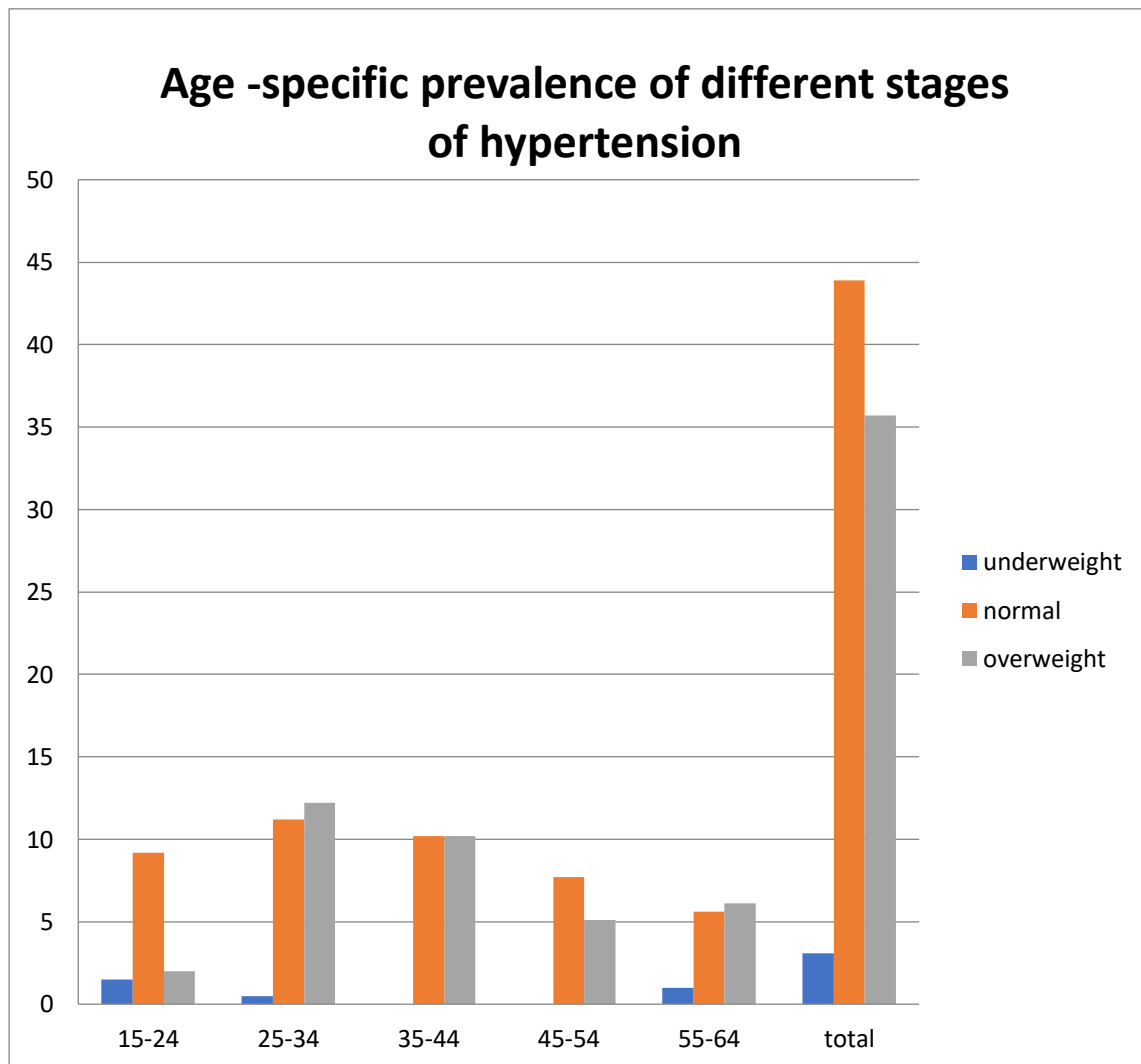

Figure 2 shows age-specific prevalence of different stages of hypertension. The prevalence of hypertension is more in the population comes under 55-64, prevalence of pre-hypertension is more in population comes under 35-44 years and the prevalence of non-hypertensive is more in population comes under 25-34 years

In the present study, we found that the overall prevalence of hypertension was 15.3%. This was more in females (8.7%) as compared to males (6.6%) and this difference was statistically significant ( $p<0.001$ ). Gender wise and age wise prevalence of hypertension is shown in Table 2. A total of 42.3% of population comes under non-hypertensive stage, 42.3% comes under pre-hypertensive stage and 15.3% comes under hypertensive stage. The prevalence of hypertension is more in the population comes under 55-64, prevalence of pre-hypertension is more in population comes under 35-44 years and the prevalence of non-hypertensive is more in population comes under 25-34 years when compared to other age groups and this difference was also statistically significant ( $p<0.001$ ).

**Table 2: Age and Sex wise prevalence of hypertension**

|                       |              | Non-hypertensive |      | Pre-hypertensive |      | Hypertensive |      | total | total |

Chi Square (gender): df-2,  $p<0.001$ ; Chi Square (age): df-8,  $p<0.5$

Figure 3 shows gender-specific prevalence of BMI and it clearly shows the prevalence of Overweight and obesity is more in females compared to males.

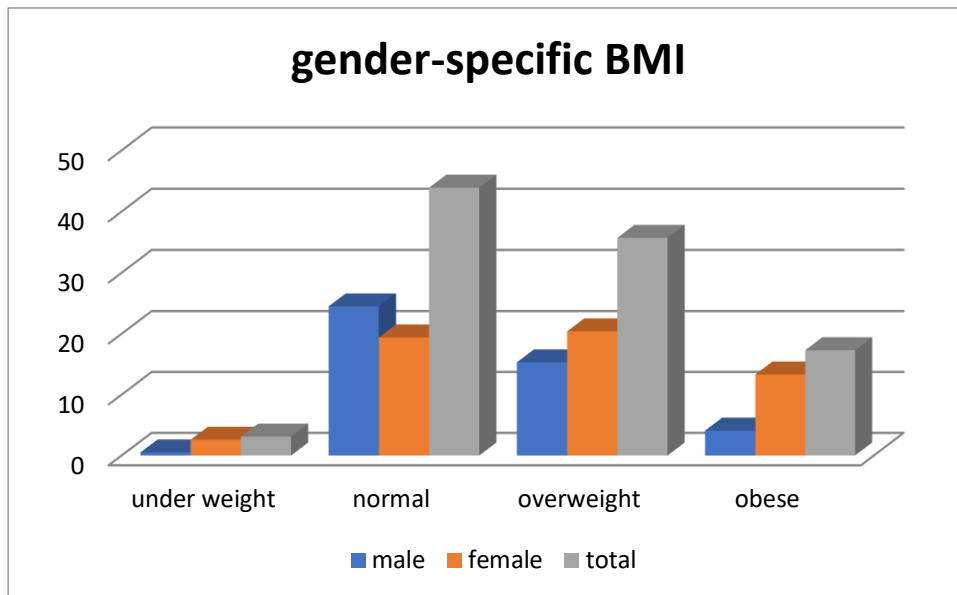

Figure 4 shows the age-specific prevalence of BMI and shows that the prevalence of overweight is maximum in the population of age group 25-34 years and the prevalence of obesity is maximum in the population of age group 35-44 years

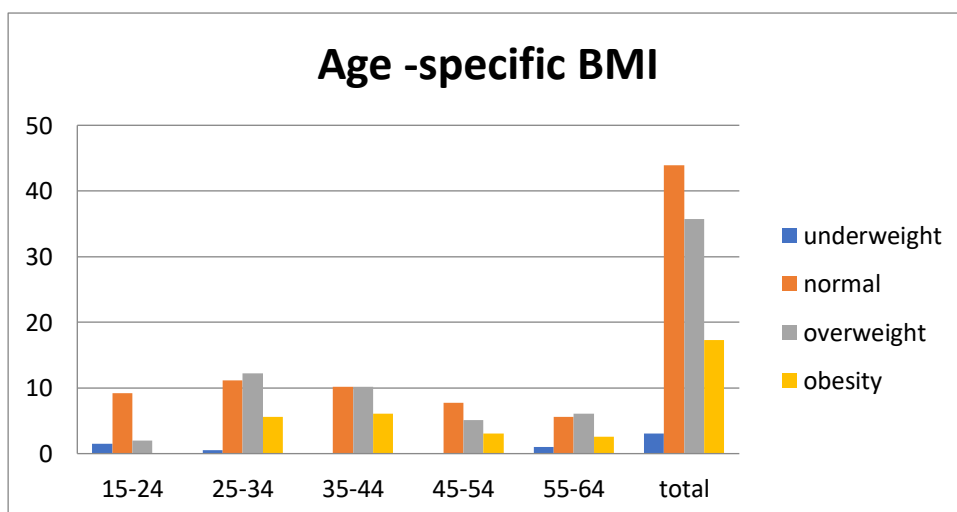

Table 3 shows the gender and age specific BMI which in turn is showing the prevalence of underweight, normal weight, overweight and obesity among study population and prevalence of overweight and obesity is more in female (33.7%) as compared to male (19.4%) and this difference was statistically significant ( $p<0.001$ ).

## DISCUSSION:

The present study showed that the prevalence of hypertension was higher in female as compared to male and the prevalence of pre-hypertension was higher in males as compared to females. Prashant R Kokiwar et al reported a high prevalence of hypertension in females in comparison to males. Jugal Kishore et al. also reported high prevalence of hypertension in females when compared to males. Ajeet S. Bhadoria et al in contrast to this study found more prevalence of hypertension in males in comparison to females.<sup>[26]</sup> There was significant gender-specific difference found in the prevalence of hypertension as p value was less than 0.05.<sup>[27]</sup> This study showed the prevalence of obesity and overweight is more in females than males. Avita Rose Johnson et al. found more prevalence of obesity in females as compared to males. The study showed that the BMI is associated with hypertension and it is the risk factor of hypertension. People who are obese are at more risk of getting hypertension compared to those with normal weight. Sung-Hee Lee et al in their study have found that there is strong association between Obesity and hypertension.<sup>[28]</sup>

Among modifiable factors, there was no association seen with smoking, tobacco, stress and physical activity. This is inconsistent with findings of other studies where these factors are found to be associates with hypertension. This may be due to the less use of smoking and tobacco in this population. In this study Alcohol was found to be associated with hypertension as alcohol was statistically significant with hypertension. Sushil K. Bansal et al. have shown the association of Alcohol with hypertension in their study.

## **CONCLUSION:**

It can be concluded that hypertension and obesity are prevalent among the adults of urban poor of Delhi in the study but this prevalence is quite lesser than the prevalence of hypertension and obesity given in NFHS-5 data. The prevalence of hypertension is significantly associated with obesity and overweight. The people who are overweight and obese are at more risk of getting hypertension comparatively to non-obese persons.

## **RECOMMENDATIONS:**

- ✓ It highlights the rising burden of NCDs like hypertension among urban poor. As hypertension is a life-threatening disease so proper awareness of the disease among urban poor is very important and measures should be taken by the government of the country for prevention and control of hypertension in this urban poor population.
- ✓ Information, education and communication activities (IEC) should be started to increase the awareness of people to adopt healthy life style.

## **ANNEXURE:**

### **ANNEX A- Consent Form**

Namaste. My name is Dr. Manika Khajuria. I am working with International Institute of Health Management (IIHMR Delhi. You have been randomly selected based to participate in this survey and we would therefore like to interview you. The title of the study is “TO ESTIMATE THE PREVALENCE OF OBESITY AND HYPERTENSION AMONG ADULTS LIVING IN URBAN SLUM IN DELHI: A CROSS-SECTIONAL STUDY”

We are trying to assess the prevalence of hypertension and obesity among adults living in urban slum in Delhi. The interview will take approximately 20-25 minutes. I will ask you questions about:

- Some personal details
- Your lifestyle activities including diet and physical activity that you generally carry out
- Some stress related questions

The information you provide is totally confidential and will not be disclosed to anyone. It will only be used for research purposes. Your name, address, and other personal information will be removed from the questionnaire, and only a code will be used to connect your name and your answers without identifying you.

Your participation in the survey is voluntary. If I ask you any question you don't want to answer, just let me know and I will go on to the next question or you can stop the interview at any time.

Also, if you consent, we will be measuring your Blood Pressure, pulse rate. Height, Weight, and Waist and hip circumference. We will not be recording this interview or taking any photographs without your permission.

If you have any questions about this survey, you may ask me or

If you have any further questions about this survey, you may contact me

|     |   |   |        |
|-----|---|---|--------|
| 3.1 | How physically demanding is your work?<br>[Hint: Intense Activities: Those that cause rapid breathing like running, walking briskly up a hill, moving heavy loads, heavy shoveling, digging ditches, fast | Strenuous or has intense activities.....<br>Sedentary or has moderate activities..... | 1<br>2 |
|-----|---|---|--------|

|     |  |            |  |
|-----|--|------------|--|
|     | swimming and competitive sports<br><b>Moderate Activities:</b><br>Slightly accelerates breathing like brisk walking, gardening, dancing, household chores, involvement in games, construction, carrying loads] |            |  |
| 3.2 | In a typical week, on how many days do you do vigorous-intensity activities as part of your work?  | ..... days |  |

#### 4. Stress

**Introduction:** Now I am going to ask few questions about how you spent your time and how you felt yesterday, [yesterday's sunrise to sunset]. Please try to answer as honestly as you can.

#### **Perceived Stress Scale (PSS)**

|            |   |  |                       |
|------------|---|--|-----------------------|
| <b>4.1</b> | In the last month, how often have you been upset because of something that happened unexpectedly?             | Never.....<br>Almost Never.....<br>Sometimes.....<br>Fairly often.....<br>Very often.....  | 0<br>1<br>2<br>3<br>4 |
| 4.2        | In the last month, how often have you felt that you were unable to control the important things in your life? | Never.....<br>Almost Never.....<br>Sometimes .....<br>Fairly often.....<br>Very often..... | 0<br>1<br>2<br>3<br>4 |
| 4.3        | In the last month, how often have you felt nervous and stressed?  | Never.....<br>Almost Never.....<br>Sometimes .....<br>Fairly often.....<br>Very often..... | 0<br>1<br>2<br>3<br>4 |
| 4.4        | In the last month, how often have you felt confident about your ability to handle your personal problems?     | Never.....<br>Almost Never.....<br>Sometimes .....<br>Fairly often.....<br>Very often..... | 0<br>1<br>2<br>3<br>4 |
| 4.5        | In the last month, how often have you felt that things were going your way?                                   | Never.....<br>Almost Never.....<br>Sometimes .....<br>Fairly often.....<br>Very often..... | 0<br>1<br>2<br>3<br>4 |
| 4.6        | In the last month, how often have you found that you could not cope with                                      | Never.....<br>Almost Never.....<br>Sometimes .....   | 0<br>1<br>2           |

|      |  |  |                       |
|------|--|--|-----------------------|
|      | all the things that you had to do?   | Fairly often.....<br>Very often.....   | 3<br>4                |
| 4.7  | In the last month, how often have you been able to control irritations in your life?                             | Never.....<br>Almost Never.....<br>Sometimes .....<br>Fairly often.....<br>Very often..... | 0<br>1<br>2<br>3<br>4 |
| 4.8  | In the last month, how often have you felt that you were on top of things?                                       | Never.....<br>Almost Never.....<br>Sometimes .....<br>Fairly often.....<br>Very often..... | 0<br>1<br>2<br>3<br>4 |
| 4.9  | In the last month, how often have you been angered because of things that happened were outside of your control? | Never.....<br>Almost Never.....<br>Sometimes .....<br>Fairly often.....<br>Very often..... | 0<br>1<br>2<br>3<br>4 |
| 4.10 | In the last month, how often have you felt difficulties were piling up so high that you could not overcome them? | Never.....<br>Almost Never.....<br>Sometimes .....<br>Fairly often.....<br>Very often..... | 0<br>1<br>2<br>3<br>4 |

## 5. Blood Pressure Measurement

### Ask consent for Blood pressure measurement

**Instructions:** First I would like to measure your blood pressure and pulse rate. Stay seated, and once I put this (cuff) on your wrist, keep it steady and at the level of your heart. We will need to take the blood pressure reading three times. It will squeeze your wrist a bit but won't hurt. Relax.

INTERVIEWER: respondent should remain seated. Demonstrate to the respondent how to hold their arm while the machine is measuring. Place the monitoring device on the wrist and have the respondent hold it at heart level against his/her chest. When the device is in the correct position and respondent is relaxed, press the button to start. Check to make sure it is working. Collect the blood pressure and pulse three times with one minute between each measurement. You do not need to remove the device between measurements.

|     |        |   |  |
|-----|--------|---|--|
| 5.1 | Time 1 | Systolic <input type="text"/> <input type="text"/> <input type="text"/> mm of Hg<br>Diastolic <input type="text"/> <input type="text"/> <input type="text"/> mm of Hg<br>Pulse rate <input type="text"/> <input type="text"/> <input type="text"/> / minute |  |
|-----|--------|---|--|

INTERVIEWER: Ask the respondent to release the arm and relax. Wait for one minute before time 2. Okay, now we can get your second measurement for your blood pressure.

|   |                                       |   |  |
|---|---------------------------------------|---|--|
| 5.2   | Time 2                                | Systolic <input type="text"/> <input type="text"/> <input type="text"/> mm of Hg<br>Diastolic <input type="text"/> <input type="text"/> <input type="text"/> mm of Hg<br>Pulse rate <input type="text"/> <input type="text"/> <input type="text"/> / minute |  |
| INTERVIEWER: Again, remind the respondent to relax. Okay, now we can get your third measurement for your blood pressure.  |                                       |   |  |
| 5.3   | Time 3                                | Systolic <input type="text"/> <input type="text"/> <input type="text"/> mm of Hg<br>Diastolic <input type="text"/> <input type="text"/> <input type="text"/> mm of Hg<br>Pulse rate <input type="text"/> <input type="text"/> <input type="text"/> / minute |  |
| <b>6. <u>Anthropometric Measurements for BMI / WHR</u></b>  |                                       |   |  |
| <b><u>Instructions:</u></b> I would now like to measure how tall you are. To measure your height, I need you to please take off your shoes. Put your feet and heels close together, stand straight and look forward standing with your back, head and heels touching the wall. Look straight ahead. |                                       |   |  |
| 6.1   | Measured <b>height</b> in centimeters | <input type="text"/> <input type="text"/> <input type="text"/> . <input type="text"/> centimeters<br><br><input type="checkbox"/> Refused<br><br><input type="checkbox"/> Not able  |  |
| <b><u>Instructions:</u></b> Now we want to measure your weight - could you please step on this scale. We will also measure your waist and hips using a tape measure.  |                                       |   |  |
| 6.2   | Measured <b>weight</b> in kilograms   | <input type="text"/> <input type="text"/> <input type="text"/> . <input type="text"/> centimeters<br><br><input type="checkbox"/> Refused<br><br><input type="checkbox"/> Not able  |  |

## ANNEX C- PICTORIAL JOURNEY
