**Draft Report of Dissertation Project**

**Topic:** Assessment of composite health index tool for  
High Priority Districts

**Name of Organization:** MSG Strategic Consulting  
Pvt.Ltd

**Submitted to**

Dr.Vinay Tripathi  
Assistant Professor  
IIHMR DELHI

**Submitted by**

Mrinalini Dixit  
PG/14/036  
Batch 2014-16

### Certificate of Approval

The following dissertation titled "Assessment of Composite Health Index toll for High priority Districts" at "MSG Strategic Consulting Pvt.Ltd" is hereby approved as a certified study in management carried out and presented in a manner satisfactorily to warrant its acceptance as a prerequisite for the award of **Post Graduate Diploma in Health and Hospital Management** for which it has been submitted. It is understood that by this approval the undersigned do not necessarily endorse or approve any statement made, opinion expressed or conclusion drawn therein but approve the dissertation only for the purpose it is submitted.

Dissertation Examination Committee for evaluation of dissertation.

FEEDBACK FORM

Name of the Student: Dr. Mrinalini Dixit

Dissertation Organization: MSG Strategic Consulting Pvt. Ltd

Area of Dissertation: Health development department

Attendance: Regular

Objectives achieved: Yes

Deliverables: Report on Assessment of Composite Health Index Tool for High Priority Districts

**Strengths:**

Eagerly pursues new knowledge, skills, and methods. She has grown in the last few months by giving promising result through a steady performance. The growth path is definitely positive.

**Suggestions for Improvement:**

Needs better industry knowledge; this could be achieved with work experience and exposure to various forums.

*Samrat Rath*

(Completion of Dissertation from respective organization)

The certificate is awarded to

Name – Dr. Mrinalini Dixit

In recognition of having successfully completed her Internship in the department of

Health development

And has successfully completed her Project on

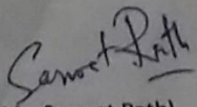

Assessment of Composite Health Index Tool for High Priority Districts

Date- 10/5/2016

Organization- MSG Strategic Consulting Pvt.Ltd

She comes across as a committed, sincere & diligent person who has a strong drive & zeal for learning

We wish him/her all the best for future endeavors

  
(Mr. Saswat Rath)

(Associate Director)

**Certificate from Dissertation Advisory Committee**

This is to certify that Dr. Mrinalini Dixit, a graduate student of the Post- Graduate Diploma in Health and Hospital Management has worked under our guidance and supervision. He/ She is submitting this dissertation titled "**Assessment of Composite Health Index Tool For High Priority Districts**" at "**MSG Strategic Consulting Pvt.Ltd**" in partial fulfillment of the requirements for the award of the Post-Graduate Diploma in Health and Hospital Management.

This dissertation has the requisite standard and to the best of our knowledge no part of it has been reproduced from any other dissertation, monograph, report or book.

TO WHOMSOEVER IT MAY CONCERN

This is to certify that Dr. Mrinalini Dixit student of Post Graduate Diploma in Hospital and Health Management (PGDHM) from International Institute of Health Management Research, New Delhi has undergone internship training at MSG strategic consultancy Pvt. Ltd. From 8<sup>th</sup> Feb. 2016 TO 13<sup>th</sup> May. 2016

The Candidate has successfully carried out the study designated to him during internship training and his approach to the study has been sincere, scientific and analytical.

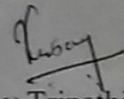

The Internship is in fulfilment of the course requirements.

I wish him all success in all his future endeavours.

Dr. A.K. Agarwal

Dean, Academics and Student  
Affairs IIHMR, New Delhi

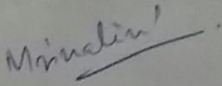

Dr. Vinay Tripathi,

Assistant Professor,  
IIHMR, New Delhi

INTERNATIONAL INSTITUTE OF HEALTH MANAGEMENT RESEARCH,  
NEW DELHI

This is to certify that the dissertation titled **Assessment of Composite Health Index tool for High Priority Districts** and submitted by **Dr. Mrinalini Dixit** Enrollment No. PG/14/036 under the supervision of **Dr. Vinay Tripathi** for award of Postgraduate Diploma in Hospital and Health Management of the Institute carried out during the period from **8<sup>th</sup> February 2016** to **13<sup>th</sup> May 2016** embodies my original work and has not formed the basis for the award of any degree, diploma associate ship, fellowship, titles in this or any other Institute or other similar institution of higher learning.

### **Acknowledgment**

This project consumed huge amount of work, research and dedication. Still, implementation would not have been possible if we did not have a support of many individuals and organizations. Therefore we would like to extend our sincere gratitude to all of them.

First of all I am thankful to Mr. S Basavraj and Mr. Saswath Rath, MSG Strategic Consulting Pvt Ltd, Delhi Office for their Intellectual and logistical support and for providing necessary guidance concerning projects implementation. I am also grateful for provision of expertise, and technical support in the implementation. Without their superior knowledge and experience, the Project would like in quality of outcomes, and thus their support has been essential.

It is my radiant sentiment to place on record my best regards, deepest sense of gratitude to my mentor **Dr. Vinay Tripathi**, for his careful and precious guidance which were extremely valuable for my study both theoretically and practically.

I perceive this opportunity as a big milestone in my career development. I will strive to use gained skills and knowledge in the best possible way, and I will continue to work on their improvement, in order to attain desired career objectives.

Nevertheless, I express my gratitude toward my friends Dr. Mohsin Khan, Mansi Jain, Dr. Isha Porwal, Dr. Karishma Tanwar and Dr. Nabella Ilyas for their kind co-operation and encouragement which help us in completion of this project. Their support and perseverance towards me has allowed me to reach to this milestone in my professional life.

Last but not the least, I am greatly indebted to my parents Mr. Man Mohan Dixit and Mrs. Alka Dixit along with my grandparents, my brother and sister in law for their constant love, patience understanding and unfailing source of encouragement, moral support and sacrifices. Their optimism and blessing worked to what I have achieved and is a reflection of their hardship.

Dr. Mrinalini Dixit

## **Abstract**

Evidence suggests that social and economic factors are important determinants of health. Ever-increasing evidence suggests that the health of a population is greatly determined by the social and economic circumstances of that population, as well as its access to health care services. Measuring health as the individual would be creating a bias of the development of the area. Measuring health and socioeconomic factors will be essential for seeking the intersectoral coordination. Selection of high priority districts over the parameters of only health disregards the above statement. High priority districts should be selected after taking into account all the factors affecting the health i.e. Social as well as the economic status of the district.

**Objective:** This study attempts at presenting the high priority districts taking into consideration all the three factors of development social, economic and health.

**Materials and methods:** Two states selected (convenience sampling) with calculation and ranking of districts in composite health index. Calculation of social and economic index from District level human development index. Generation of priority index which complies all the three indicators and comparison between the high priority districts from CHI and high priority districts from.

**Conclusion:** There is a change in the ranking of the states on new index which shows that when districts measured in social and economic status along with health result in a change in the picture in the requirements of the districts.

### **Abbreviations**

CHI- Composite Health Index

HDI- Human Development Index

PI- Priority Index

GOI- Government of India

MoHFW- Ministry of Health And Family Welfare

RMNCH+A- Reproductive, Maternal, Newborn, Child, and Adolescent Health

NHM- National Health Mission

HPD- High Priority Districts

MMR- Maternal Mortality Ratio

IMR- Infant Mortality Rate

TFR- Total Fertility Rate

DLHS- District Level Household Survey

AHS- Annual Health Survey

HDR- Human Development Report

SHDR- State Human Development Report

DHDR- District Human Development Report

GER- Gross Enrollment Rate

## **Introduction of the organization**

Incorporated in 1994, MSG Strategic Consulting Pvt. Ltd. (MSG) is a well-established management consulting company (<http://www.msg.net.in>) with experience of working:

- With international agencies such as USAID, DFID, World Bank, UNICEF and UNFPA
- With local, national and international NGOs and community based structures
- With public sector companies, public utilities and government departments
- With private sector companies ranging from small-scale units to some of India's largest business groups and multinational corporations
- In a wide range of sectors including health, rural & urban development, water & sanitation, environment and industry
- In South Asia – most states in India, Nepal, and Zambia.
- In collaboration with leading international consulting companies from Denmark, UK, Netherlands and USA.

## **Scope of services**

Services offered by MSG include:

- Management of development projects
  - Sector wide approach
  - Project identification
  - Project formulation including log frame analysis
  - Preparation of project document and action plan
  - Economic and financial including sensitivity analyses

- Project monitoring including identification of project indicators and MIS
- Impact assessment including social, economic, environmental etc.
- Evaluation of projects including gender screening
  
- Governance including training
  - Policy and legislation
  - Institutional arrangements including role of NGOs, CBOs, etc.
  - Institutional development: organization structure and manning levels; job descriptions including basis for performance appraisal and person specifications, job evaluation, authority limits
  - Management of training including training needs assessment and development of training packages
  
- Economic studies and corporate strategy
  - Estimation of present and future demand and supply
  - Assessment of government policies
  - Cost benefit analysis
  - Requirement of land, building, equipment and manpower
  - Project cost/ working capital requirements
  - Alternative sources of finance
  - Cash flow, profitability projections and calculation of expected rates of return
  - Assessment of risk and sensitivity analyses

## **1. INTRODUCTION**

The GOI is committed to protecting the lives and health of women, adolescents, and children. At the Global Child Survival Call to Action: A Promise to Keep in 2012, India's Honorable Minister for Health and Family Welfare assured the audience that India would remain at the forefront of the global war against maternal and child mortality. Eight months after the event, the Government of India held its own historic Summit on the Call to Action for Child Survival, where it launched "A Strategic Approach to Reproductive, Maternal, Newborn, Child, and Adolescent Health (RMNCH+A) in India." Since that time, RMNCH+A has become the heart of the GOI's flagship public health program, the National Health Mission (NHM)<sup>i</sup>

### **1.1 RMNCH+A**

#### **REPRODUCTIVE AND CHILD HEALTH PROGRAMME**

Reproductive and Child Health Programme" (RCH) main objective was to bring about a change in the three critical health indicators of Maternal Mortality Ratio (MMR), Infant Mortality Rate (IMR) and Total Fertility Rate (TFR), consistent with the health goals of the National Population Policy 2000, the National Health Policy-2002, the Millennium Development Goals (MDGs), and the 12th Five Year Plan. <sup>ii</sup>

To accelerate progress towards attainment of MDGs 4 and 5, and to reduce under-five mortality, Government of India has initiated a strategic Approach to Reproductive, Maternal, Newborn, Child and Adolescent Health (RMNCH+A) that embodies its vision for comprehensive and integrated health services, most importantly for adolescents,

mothers and children. This has resulted in an ever-growing and dynamic list of interventions and service packages across the reproductive, maternal and child health spectrum.<sup>ii</sup>

The Reproductive, Maternal, Newborn, Child and Adolescent Health (RMNCH+A) Strategy is at the heart of GOI's flagship public health program – the National Health Mission. The strategy is based on provision of comprehensive care through five pillars, or thematic areas--reproductive, maternal, newborn, child, and adolescent health--and is guided by central tenets of equity, universal care, entitlement and accountability.<sup>iii</sup>

### MAIN FEATURES OF THE PROGRAMME

The core components of the RCH Programme are Maternal Health, Child Health, Family Planning, Adolescent Health, and Pre-Conception & Pre-Natal Diagnostics Techniques (PC-PNDT).

The Programme aims to improve the performance of NHM by reducing maternal and infant morbidity and mortality and unwanted pregnancies, leading to stabilization of population growth. It has been re-oriented and re-vitalized to give it a pro-outcome and pro-poor focus. The RCH Programme was being implemented around the key principles of:

- Adoption of a sector - wide approach, which effectively extends the Programme's reach beyond RCH to the entire Family Welfare sector.
- Building State /UT ownership by involving States and UTs from the outset in developing the Programme and decentralizing to the district and State levels through development of need-based plans with a flexible programming approach.

- Capacity building at the district, State and Central levels to ensure improved programme implementation.
- Adoption of the Logical Framework as a programme management tool to support an outcome-driven approach.
- Performance-based funding to ensure adherence to programme objectives, reward good performance and support weak performers through enhance technical assistance.
- Convergence, both inter-sectoral and intra-sectoral to optimize utilization of resources and infrastructure facilities.

In the last years the Reproductive and Child Health Programme have provided the flexibility and opportunity to introduce new interventions and to pilot and scale up innovative service delivery mechanisms. This has resulted in a growing list of interventions and service packages across the reproductive, maternal and child health spectrum. With the expansion of the health infrastructure, additional managerial capacity and financial resources, it is being felt that the service packages are implemented and managed in independent units and with a focus on achieving a certain health goal or a set of indicators<sup>iv</sup>

GOI has taken important steps to introduce and support RMNCH+A implementation such as<sup>v</sup>

1. Inter-linkages between different interventions at various stages of the life cycle
2. Linking child survival to other inventions such as reproductive health, family planning, maternal health
3. Sharper focus on adolescents
4. Recognizing nurses as ‘pivots’ for service delivery

5. Expanding focus on child development and quality of life

**6. Intensification of activities in High Priority Districts (HPD)**

**1.2 High priority districts**

With the agenda of ‘‘reaching the unreached’’ the Ministry of Health and Family welfare introduced the concept of **High focus districts**. High focus districts are decided on the basis of parameters like the maternal mortality ratio, infant mortality rate, institutional deliveries, malnourished children, immunization and fertility rate.<sup>v</sup>

They were focused onto the RCH indicators to achieve MDG goal 4 and 5. From the data of DLHS-3(2007-08) districts in states were identified as high focus districts. These districts had the most vulnerable and tribal population to which the health action of the states were directed depending unto the requirement of the district.

In order to further accelerate the decline in maternal and child mortality and galvanize unified efforts of all stakeholders a ‘Call to Action: For Every Child in India’ summit was organized 7-9 February 2013 in Mahabalipuram, Tamil Nadu. The summit was led by the Ministry of Health and Family Welfare with participation from Department of the Women and Child Development, and diverse set of stakeholders including civil society, UN agencies, development partners, global experts, private sector and media.<sup>vi</sup>

Following the Summit, discussions were held in the Ministry regarding intensification of efforts across the country. Based on a **composite health index**, relative ranking of districts was done within a State and bottom 25% of the districts as well as those affected by Left Wing Extremism were selected across 29 states. These are designated as High Priority Districts (HPDs) The high focused district were renamed to High priority districts and the

districts were computed on the indicators selected, where attention must be focused and integrated planning and monitoring of RMNCH+A interventions should be undertaken.<sup>v</sup>

### **Identification of HPD**

Under National Rural Health Mission, earlier 264 districts were identified as high focus districts based on DLHS-3 (2007-08) data. Now, 184 priority districts have been identified based on the results of recently released Annual Health survey in Nine Empowered Action group (EAG) States and available DLHS 3 data. The priority districts have been identified by their relative rankings within a state.<sup>vii</sup>

Uniform and clearly defined criteria have been used for defining the identification of High Priority Districts. Relative ranking of districts has been done within a State (based on a composite index) and bottom 25% of the districts be selected as High Priority Districts for that State. It was decided that for the 9 EAG States & Assam, AHS data may be used and for the remaining States /UTs, DLHS-3 data may be used.<sup>v</sup>

The following 6 indicators are to be used for 9 AHS States, (Assam, Bihar, Chhattisgarh, Jharkhand, Madhya Pradesh, Odisha, Rajasthan, Uttar Pradesh and Uttarakhand) covering one impact and one outcome indicator representing each of the areas of maternal health, child health and family planning:

### **Composite Health Index<sup>3</sup>**

- Maternal Mortality Ratio (MMR)
  - % of Safe Deliveries
- } maternal health

- Infant Mortality Rate (IMR)
  - % of Children 12-23 months fully immunized
  - Total Fertility Rate (TFR)
  - Contraceptive Prevalence Rate (CPR) – Modern Method
- } child health
- } family planning

For the remaining 26 non-AHS States / UTs, for which data on impact indicators is not available from AHS, 2 process / outcome indicators will be selected covering each of the three areas namely, maternal health, child health and family planning. It was decided to have following 6 indicators for non-AHS States:

- % of mothers received at least 3 ANC visits
  - % of Safe Deliveries
  - % of Children 12-23 months fully immunized
  - % of Children aged 6 months and above exclusively breastfed
  - % of births of order 3 and above
  - Contraceptive Prevalence Rate (CPR) – Modern Method
- } maternal health
- } child health
- } family planning

The ranking of the districts was done independently within each State and a list of the bottom 25% districts so identified was prepared. LWE and tribal districts falling in the bottom 50% districts were also included in the list. The districts included in the list will be called “High Priority Districts”. High priority districts must receive at least 30% more budget per capita compared to the other districts.

184 districts are identified as High Priority District.<sup>viii</sup>

### **1.3 Human Development Index**

The Human Development Index is a composite index comprising of levels of human development in education, longevity or health, and in access to opportunities measured in per capita incomes. Generated and computed by UNDP to measure the development of the humans residing in a nation. It started as a country level exercise.<sup>ix</sup>

It measured the human development on equality on three parameters namely education, health and standard of living.

#### **District level HDI**

Initiated in 1999 with the project **Capacity Building for preparation of State level Human Development Reports (1999-2005)**, this collaboration was followed by the second project on **Strengthening State plans for Human Development (2004-2009)**. In the first phase, the focus was on developing local capacities for preparation of State HDRs. Twenty one Indian States have prepared their HDRs in this phase. The second project focused on mainstreaming human development in State planning with activities spread across 15 States focusing on preparation of district level HDRs, engendering planning, strengthening statistical systems, and capacity development for human development and providing options for financing human development.<sup>x</sup>

In the present phase of decentralized planning in India district planning has assumed a great deal of importance. For a greater development and improvement of the districts the process of preparation of District HDRs has in many States been linked to district planning. The Planning Commission has recommended preparation of DHDRs for all districts.

The Ministry of Home Affairs has recommended DHDR template for preparation of District Gazetteers. The DHDRs are recognized as the ultimate source of district data and analysis. The process of preparation of SHDRs has brought to light gaps in district level data systems. District HDRs present disaggregated data at the sub-district level.

Tracking of the performance at the state, district level becomes more appropriate with the presence of appropriate database development, and availability of relevant data at appropriate time makes it more crucial. The world's first State HDR was published in Madhya Pradesh in 1995 and included the computation of the State's HDI as well as HDI for all the districts in the State. Madhya Pradesh followed up its first HDR by releasing three more HDRs in 1998, 2002 and 2007. A similar independent process of preparing a State HDR in Karnataka was initiated in 1997 and the report was released in 1999<sup>xi</sup>. In given time more states are being enrolled in this activity for generation of human development report in states as well as district level HDI report. 21 States are involved in computation of states and district level HDI reports.

### **Methodology of HDI computation for district level**

There are two sets of methodology that have been proposed for computation of HDI of districts. They are NHDR methodology suggested by planning commission of INDIA and other is on the basis of UNDP HDI methodology (1999). States can select one between two methodology states above. Indicators taken into account for both the methodologies are

Attainments	UNDP Indicators	NHDR Indicators
Health	Life expectancy at birth	Life expectancy at age 1 IMR
Education	Adult literacy rate Gross enrolment ratio	Literacy rate 7+ Intensity of formal education
Income/Standard of living	Real GDP per capita in PPP\$	Per capita real consumption expenditure adjusted for

		inequality
--	--	------------

Majority of the States employ the UNDP methodology( 1999) of HDI<sup>ix</sup> to calculate the HDI value for the state and district level because of ease of data availability(stated by state reports methodology). However due to lack of information for computing health index at district level the States have employed a mixed bag of indicators for calculating health value for HDI.

#### **1.4 Rationale**

Health is a multi-factorial and complex subject that is influence by a number of factors that are intrinsic and extrinsic. Over the developing years emphasis has been made on the intrinsic factors such as health habits, nutrition but the extrinsic factors are not in relation to health still need the required attention. In this study we try and present the importance to have extrinsic factors to be studied simultaneously with health for an all round development of the district.

#### **1.5 Research Question**

To study and assess the criteria's/indicators in composite health index employed to identifying high priority districts in selected states of India

#### **1.6 Objective**

1. To study the criteria /indicators in composite health index
2. To assess the present criteria/indicators and the development of the districts on the indicators selected.

## **2. Review of literature**

Few of the articles pertaining to the assessment of the health index are mentioned below

### **a) Using Composite Health Status Measures to Assess the Nation's Health.**

Erickson, Pennifer MS; Kendall, E Allen MS; Anderson, John P. PhD; Kaplan, Robert M. PhD

Research in progress at the National Center for Health Statistics for evaluating the usefulness of composite measures of health status for assessing the nation's health is described. Three measures suitable for use in the general population, the Health Insurance Experiment-Functional Limitations (HIE-FL), the Health Utility Index (HUI), and the Quality of Well-being (QWB) scale, have been mapped to data collected in the 1980 National Health Interview Survey (NHIS). Analysis using current algorithms for making composite function status measures according to the QWB methods suggests that traditional single indicators of health tend to overestimate the level of health by about 10%. When symptoms and problems are added to the composite function score, the overestimate as measured by the single indicator is at least 50%.

**b) A Data-Level Fusion Model for Developing Composite Health Indices for Degradation Modeling and Prognostic Analysis**

Kaibo Liu; H. Milton Stewart School of Industrial and Systems Engineering, Georgia Institute of Technology, Atlanta, GA, USA ; Nagi Z. Gebraeel ; Jianjun Shi

In this paper, we present a methodology for constructing a composite health index for characterizing the performance of a system through the fusion of multiple degradation-based sensor data. This methodology includes data selection, data processing, and data fusion steps that lead to an improved degradation-based prognostic model. Our goal is that the composite health index provides a much better characterization of the condition of a system compared to relying solely on data from an individual sensor. Our methodology was evaluated through a case study involving a degradation dataset of an aircraft gas turbine engine that was generated by the Commercial Modular Aero-Propulsion System Simulation (C-MAPSS).

**c) Health status: types of validity and the index of well-being.**

R M Kaplan, J W Bush, and C C Berry

The concept of validity as it applies to measures of health and health status is examined in the context of a set of standard, widely accepted definitions of validity. Criterion validity is shown to be irrelevant to health status measures because of the lack of a single specific, directly observable measure of health for use as a criterion. To overcome this problem, the Index of Well-being has been constructed to fulfill the definition of content validity by including all levels of function and symptom/problem complexes, a clearly defined relation to the death state, and consumer ratings of the relative desirability of the function levels. Data from a two-wave household interview survey Discriminant evidence of construct validity is demonstrated by predicted differences in correlation between concurrent Index of Well-being scores and self-assessed overall health status, and between the Index of Well-being scores and self-rated well-being on different days. A simple method of estimating a currently usable comprehensive population index of health status, the Weighted Life Expectancy, is described.

### 3. Methodology

- Sample size- Two states selected (convenience sampling)with high priority districts
- Data collection tool: DLHS-IV, Annual performance report of individual states to NHM, Publishes reports, publishes articles. HDR of the state
- Method of data collection: Secondary Research data collection
- Tools - Assessment and Interpretation of the indicators in graphical, tabulator form using Microsoft excel.
  - Analytical tool :
    - Correlation analysis between different components of indices
- Health situation or scenario of the districts of the selected study states is studies in detail and is noted as part I of the project. The composite health index is computed to identify the high priority districts of a state and ranked according value achieved by the districts on three RCH parameters namely Maternal health, Child health and family planning. It is calculated with a vision of better and fast development along with decentralized and easy gap identification at district level.
- The individual state was studies on the district level and the CHI value and ranking is studied and generated in the study.

- Detailed secondary study of the human development of the selected states is done through various articles reports and publishing. The reports published by the state of Maharashtra and Karnataka are studied on all the parameters on education, health and standard of living.
- All the districts of the state are studied in a detailed manner on both the indices and the correlation value of each indicator with indices is generated to know the effect individual effect of them on the health development and human development.
- Individual district is computed on the parameters/indicators and contribution factor is identified for the districts showing the maximum and the minimum or negative growth
- For authentication of the use of CHI and HDI they are calculated individually in the study using the authentic and approved data source (CHI- DLHS III, DLHS IV) (HDI- data available in state published Human development reports) for both the states at district level for two reference year.
  - Maharashtra – CHI- DLHS 4 and DLHS 3  
HDI- data available for 2011 and 2001
  - Karnataka – CHI – DLH 3 and DLHS 4  
HDI- data available for year 2001 and 1991

**Data analysis method:** Correlation and Regression analysis

### **3.1 Study of Composite Health Index in selected study states**

Maharashtra and Karnataka both are non EAG states they employee the six process /outcome indicators.

- **Maternal health:**
  - Percentage of women received at least three ANC
  - Percentage of women having safe delivery
- **Child health:**
  - Percentage of children 12-23months fully immunization
  - Percentage of Children aged 6 months and above exclusively breastfed
- **Family planning:**
  - Percentage of women having 3+ birth order and above
  - Contraceptive Prevalence Rate (CPR) – Modern Method

The 35 districts of Maharashtra and 27 districts of Karnataka were studied on these process/outcome indicators and composite health index was calculated for each of the districts utilizing the data from DLHS2, DLHS-3 and DLHS-4.

The formula applied in calculation of the composite score to each indicator followed by the final index score or composite health index score.<sup>i</sup>

$$\text{Index Value} = \frac{X_{id} - \text{Min}(X_{id})}{(\text{Max}(X_{id}) - \text{Min}(X_{id}))}$$

Where,

$X_{id}$  - The percentage of population in the selected indicator in the  $d^{\text{th}}$  district

$\text{Max}(X_{id})$  - Max value of the indicator among the districts of the selected state

$\text{Min}(X_{id})$  - Minimum value of the selected indicator among the districts of the selected state

The index value ranges between 1 and 0

After calculating the value of each six indicator listed above. The entire individual indicator are added up and divided by six to have an average index value i.e. Composite health index

Composite health Index value=  $\frac{IV_{ANC}+IV_{SD}+IV_{BF}+IV_{Imm}+IV_{3+BO}+IV_{CPR}}{6}$

6

$$X_d = \frac{1}{6} \sum_{i=1}^6 X_{id}$$

Where,

$IV_{ANC}$ - Index value of ANC

$IV_{SD}$ - Index value safe delivery

$IV_{BF}$ - Index value exclusive breastfeeding

$IV_{Imm}$ - Index value if 12-23months of children fully immunized

$IV_{3+BO}$ - Index value of 3+and above birth order

$IV_{CPR}$ - Index value of CPR

The indicators employed in the assessment of the composite health indicator were studied in detail and their effect with change in the ranking of districts among each other. The indicators correlation with the CHI was studied on the yearly basis that they were computed from DLHS and AHS data.

### **3.2 Study of District level Human Development Index on selected study states**

Human development index is developed by UNDP to measure the development of residents of the nation upon three parameters – education level, life expectancy and standard of living of the residents of the nation. These indicators are observed at the level of nation and state level development to study the district level development of citizens in a state a modified or changed criteria was developed by UNDP that takes account:

Attainments	UNDP Indicators	NHDR Indicators
Health	Life expectancy at birth	Life expectancy at age 1 IMR
Education	Adult literacy rate Gross enrolment ratio	Literacy rate 7+ Intensity of formal education
Income/Standard of living	Real GDP per capita in PPP\$	Per capita real consumption expenditure adjusted for inequality

The formula applied in calculation of the composite score to each indicator followed by the final index score or human development score.<sup>xii</sup>

$$\text{INDEX} = \frac{\text{Actual } X_i \text{ value} - \text{minimum } X_i \text{ value}}{\text{Maximum } X_i \text{ Value} - \text{minimum } X_i \text{ value}}$$

For calculation of standard of living:

$$\text{Index} = \frac{\log(X_{id}) - \log(\min X_{id})}{\log(\text{Max}X_{id}) - \log(\text{Min } X_{id})}$$

### **For Maharashtra**

The HDI is a composite index, consisting of three indicators: longevity as measured by Infant Survival rate(ISR); education attainment as measured by a combination of literacy rate (UNDP adopts adult literacy rate) with two-third weight and combined primary and secondary enrolment ratio with one-third weight(whereas UNDP uses combined enrolment ratio of primary, secondary and tertiary education levels) and standard of living as measured by the real DP per capita expressed as PPP\$ (in Purchasing Power Parity dollars).

The Goalpost selected for the same are

<i>Dimension</i>	<i>Maximum</i>	<i>Minimum</i>
ISR (1000- IMR)	1000	0
Literacy Rate	100	0
GER	100	0
Per Capita Domestic Product (Rupees at constant prices)	1,50,000	10,000

Finally, an aggregate HDI for a given district has been calculated as a simple arithmetic mean of the normalized scores for the three dimensions.

### **For Karnataka**

The HDI is a composite index, consisting of three indicators: longevity as measured by life expectancy at birth(LEB); education attainment as measured by a combination of literacy rate (UNDP adopts adult literacy rate) with two-third weight and combined primary and secondary enrolment ratio with one-third weight(whereas UNDP uses combined enrolment

ratio of primary, secondary and tertiary education levels) and standard of living as measured by the real GDP per capita expressed as PPP\$ (in Purchasing Power Parity dollars). For the construction of the index, minimum and maximum values have been fixed for each of these indicators and they are as follow

<i>Dimension</i>	<i>Maximum</i>	<i>Minimum</i>
Life expectancy	85yrs	25yrs
Literacy Rate	100	0
GER	100	0
Per Capita Domestic Product (Rupees at constant prices)	\$40,000	\$100

Finally, an aggregate HDI for a given district has been calculated as a simple arithmetic mean of the normalized scores for the three dimensions.

The districts are ranked according to the score achieved by them in respect to each other.

### 3.3 Study of districts on Priority Index

HDI and CHI both employ the same formulae of computation of the value for the index.

Both the indices compared and studied together.

Composite health index	Index Value = $\frac{X_{id} - \text{Min}(X_{id})}{(\text{Max}(X_{id}) - \text{Min}(X_{id}))}$
------------------------	---

Human Development Index (education and income)	Index = $\frac{\text{Actual Xi value} - \text{minimum Xi value}}{\text{Max Xi Value} - \text{min Xi value}}$
---	--

The best and the worst performing districts were indentified from both the indices. The districts were evaluated on the graph to measure the difference between them.

Health index indicators were replaced by the composite health index value and the movement of districts among themselves along with the relationship of CHI with HDI is noted.

The new modified HDI is studied and if present any substantial change in the ranking and relation of the districts is studied in detail.

## 4. Data analysis and Results

The data was collected and processed in Microsoft excel (see in annexure). The index calculation and correlation and regression analysis were performed in the excel sheets that are attached in the annexure of the report.

### 4.1 Study of districts of composite health index

Using the formula of index calculation and the data from DLHS 3 and DLHS4 the performance of districts of Maharashtra on the criteria of Ministry of Health and Family welfare and they were ranked according the value identifying the High priority Districts (Table 4.1.1a and Exhibit 4.1.1a)

#### MAHARASHTRA

Table 4.1.1a: District wise ranking of Maharashtra on composite health index		
Districts	Rank (2007)	Rank (2012)
Ahmadnagar	11	22
Akola	21	11
Amravati	13	7
<b>Aurangabad</b>	<b>33</b>	<b>27</b>
Bhandara	7	12
<b>Bid</b>	<b>29</b>	<b>29</b>
Buldana	23	26
Chandarpur	6	9
<b>Dhule</b>	<b>32</b>	19
<b>Gadchiroli</b>	<b>31</b>	8
<b>Gondiya</b>	12	<b>30</b>
<b>Hingoli</b>	<b>34</b>	24
<b>Jalgaon</b>	<b>30</b>	<b>35</b>
<b>Jalna</b>	<b>28</b>	25
Kolhapur	9	3
<b>Latur</b>	26	<b>28</b>

#### Exhibit 4.1.1a

List of previous High Priority Districts

##### From DLHS 3 Data HPD are:

27. Nanded
28. Bid
29. Jalgaon
30. Dhule
31. Aurangabad
32. Jalna
33. Gadchiroli
34. Hingoli
35. Nandurbar

##### From DLHS 4 data HPD are

27. Aurangabad
28. Latur
29. Bid
30. Gondiya
31. Nanded
32. Nandurbar
33. Thane
34. Parbhani
35. Jalgaon

Mumbai	16	2
Mumbai (Suburban)	10	18
Nagpur	5	15
<b>Nanded</b>	<b>27</b>	<b>31</b>
<b>Nandurbar</b>	<b>35</b>	<b>32</b>
Nashik	24	20
Osmanabad	14	17
<b>Parbhani</b>	25	<b>34</b>
Pune	2	1
Raigarh	20	6
Ratnagiri	22	16
Sangli	8	21
Satara	3	4
Sindhudurg	4	10
Solapur	15	5
<b>Thane</b>	17	<b>33</b>
Wardha	1	14
Washim	19	23
Yavatmal	18	13

**There is change in the ranking list of High priority districts.**

**New HPD**

- Gondiya
- Parbhani
- Thane
- Latur

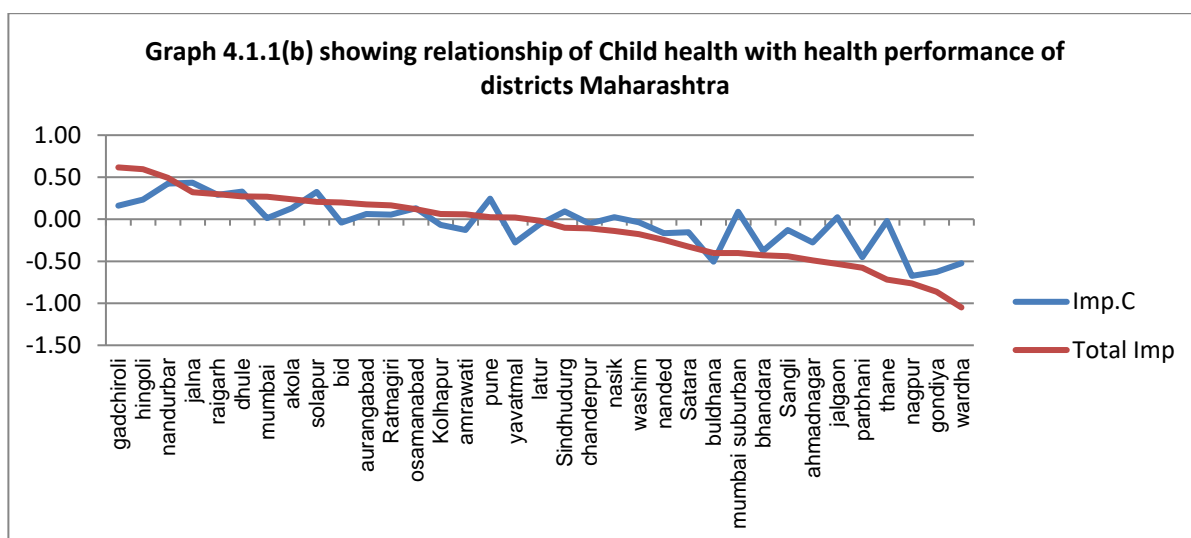

**Movement out of HPD**

- Hingoli
- Jalna
- Dhule
- Gadchiroli

Gadchiroli district has shown an overall improvement of 62% with major contribution by the better family planning indicator by 30%. It is followed by Hingoli district of Maharashtra showing a 59% of improvement in indicators with 34% in maternal health and 23% in child health indicator. Nandurbar even though still in the list of High priority list is showing marked improvement of 49% (42% child health) and a shift in the ranking from 35<sup>th</sup> to 32<sup>nd</sup> position.

Wardha has shown the most negative growth of 95% decreased growth with downward movement of the district from 1<sup>st</sup> rank to 14<sup>th</sup> rank in the new list of HPD. Latur has reentered into districts of high priority as it has shown no significant development over the years and child health is reduced by 6%. Thane has a downfall (72%) from 20<sup>th</sup> to 33<sup>th</sup> due to reduced maternal health (50%) and family planning practices (20%).

### Rank of Correlation of indicators and CHI

The correlation of the indicators were studied with the CHI value for the year 2007-08(DLHS3) and year 2012-13(DLHS 4) [Table 4.1.1(b)]

<i>Table 4.1.1b</i>				
<i>Year 2007</i>	<i>Maternal health</i>	<i>Child health</i>	<i>Family Planning</i>	<i>CHI</i>
Maternal health	1			
Child health	0.7828 (.014)	1		
Family Planning	0.3794 (0.024)	0.5110 (0.0016)	1	
<b>CHI</b>	<b>0.8652</b> <b>(0.000)</b>	<b>0.9065</b> <b>(0.00)</b>	<b>0.7471</b> <b>(0.000)</b>	<b>1</b>

<i>Year 2012</i>	<i>Maternal health</i>	<i>Child health</i>	<i>Family planning</i>	<i>CHI</i>
Maternal health	1			
Child health	0.0007 (0.009)	1		
Family planning	0.3207 (0.006)	-0.2913 (0.0089)	1	
<b>CHI</b>	<b>0.7386</b> <b>(0.000)</b>	<b>0.3726</b> <b>(0.026)</b>	<b>0.6343</b> <b>(0.000)</b>	<b>1</b>

The Coefficient of correlation has changed from the year 2007 to year 2012.

- The Cof. Of Correlation has drastically decreased for child health from 0.9065 to 0.3726
- The Cof of correlation for maternal health and family planning is also reduced.

Child health indicator correlation to the CHI used to rank highest in 2007 has reduced to the lowest in 2012 derived calculations. In 2012 the major correlation effect on the CHI is seen due to maternal health followed by the family planning indicators change. This reflects that the child health needs to be taken into consideration for the calculation of the CHI that reflects the health condition of the district

## Karnataka

### Ranking of the districts

<b>Table 4.1.2a: District wise ranking of Karnataka on composite health index</b>		
DISTRICTS	Rank (2002)	Rank (2005)
Bagalkot	23	21
Bangalore	6	4
Bangalore Rural	7	9
Belgaum	14	18
Bellary	24	22
Bidar	19	24
Bijapur	22	23
Chamarajanagar	8	11
Chikmagalur	3	8
Chitradurga	20	17
Dakshina Kannada	10	15
Davangere	17	16
Dharwad	16	14
Gadag	21	19

#### Exhibit 4.1.2a

List of previous High Priority Districts

#### From DLHS 3 Data HPD are:

21. Gadag
22. Bijapur
23. Bagalkot
24. Bellary
25. Koppal
26. Gulbarga
27. Raichur
28. Yadgir (from Gulbarga)

#### From DLHS 2 data HPD are

21. Bagalkot
22. Bellary
23. Bijapur
24. Bidar
25. Koppal
26. Raichur
27. Gulbarga

Gulbarga	26	27
Hassan	2	2
Haveri	15	20
Kodagu	5	6
Kolar	18	13
Koppal	25	25
Mandya	1	1
Mysore	4	7
Raichur	27	26
Shimoga	11	10
Tumkur	9	12
Udupi	12	3
Uttara Kannada	13	5
Yadgir	#	#

There is change in the ranking along with addition and deletion of few districts into the list of High priority districts.

#### New HPD

- Gadag
- Yadgir (parent district Gulbarga )

#### Movement out of HPD

- Bidar
- Haveri

**Graph 4.1.2(a): Districts Performance of Karnataka on CHI**

Bidar district of Karnataka moved out of list of high priority districts from 24<sup>th</sup> rank to 19<sup>th</sup> has maximum development of 80% contributed by a 43% improvement in child health followed by maternal health and family planning. Followed by Haveri which also became a non HPD by having an overall improvement of 39% (33% child health) but an decline in family planning practices. Gulbarga still as HPD has achieved a progress of 56% (25% FP practices) and has stepped up to 26<sup>th</sup> position.

Gadag gas entered the list of HPD in the year of 2007 as it has a negative growth of 30%(26% FP practices). Slipping to a position of HPD from 19<sup>th</sup> rank. Udupi district has shown the least development in the study years with a 66% downfall max reduction in FP practices with 43% and coming down to 12<sup>th</sup> rank from 3<sup>rd</sup>. Most of the districts which have fallen behind in the development are due to reduced family planning and child health practices.

#### Rank of correlation of indicators and CHI

Table 4.1.2b				
DLHS 2	Maternal Health	Child Health	Family Planning	CHI
Maternal Health	1.000			
Child Health	0.584 (.00140)	1.000		
Family Planning	0.832 (0.000)	0.675 (.0013)	1.000	
CHI	0.911 (0.000)	0.819 (.041)	0.947 (0.000)	1.000

DLHS 3	Maternal Health	Child Health	Family Planning	CHI
Maternal Health	1.000			
Child Health	0.392 (.001)	1.000		
Family Planning	0.685	0.178	1.000	

	(0.000)	(.002)		
<b>CHI</b>	<b>0.916</b> <b>(0.000)</b>	<b>0.508</b> <b>(.006)</b>	<b>0.876</b> <b>(0.000)</b>	<b>1.000</b>

The coefficient of correlation has changed from the year 2002 to year 2007

- The Cof. Of Correlation has drastically decreased for child health from [r=0.819 to 0.508]
- The Cof of correlation for maternal health and family planning is also reduced.

Child health indicator correlation to the CHI in 2002 has reduced to the lowest in 2007 derived calculations. In 2007 the major correlation effect on the CHI is seen due to maternal health followed by the family planning indicators change. This reflects that the child health needs to be taken into consideration for the calculation of the CHI that reflects the health condition of the district.

### **Inference from study of composite health index**

After studying the parameters and indicators of both the states and district it can be seen there is a constant fall in the contribution and correlation of child health in the noted CHI which needs to be addressed. As child health is now treated to be an important part of the health programme along with the allocation of budget is sensitive to the performance of districts on the composite health index.

The most fundamental causes of health disparities are socioeconomic disparities.<sup>xiii</sup>

Socioeconomic status has traditionally been defined by education, income, and occupation. Each component provides different resources, displays different relationships to various health outcomes. Eliminating health disparities will require attention to socioeconomic factors components and the pathways by which they influence health.

This is a compelling fact that give rise to the question is the composite health index enough to select districts of high priority without taking into the consideration the socioeconomic activity of the districts on the other parameters which affect the health of the district such as the health seeking behavior and factor affecting health. Factors such as economic background and education status of the district are high influential factor that should be taken into consideration to take into account the need of the district.

In the following part we study on the districts over the HDI parameter to assess the approximation of CHI to the development of the district.

#### **4.2 Study of districts on Human Development Index**

Using the formula of index calculation and the data from published human development reports of state the performance of districts of Maharashtra and Karnataka the district level HDI is calculated and the districts are ranked according the value identifying the high performing and low performing districts

##### **Maharashtra**

The district value for each of the HDI indicator was taken from the SHDR and the index calculation formula was applied to the districts to have the value and rank of the districts on best and least performing indicators. The district performance is calculated for the two years[ 2001 and 2011]with data availability and the growth of each district is studied

<b>Table 4.2.1a: District wise ranking of Maharashtra on human development index</b>				
	Low	Medium	High	Very high
Districts (2001)	Nandurbar, Gadchiroli, Jalna, Washim, Nanded, Hingoli, Buldana, Parbhani, Dhule	Osmanabad , Yavatmal, Latur, Beed, Gondiya, Bhandara, Jalgaon, Solapur	Ahmednagar, Ratnagiri Akola, Amravati Wardha, Chanderpur Aurangabad, Nasik	Satara , Sindhudurg , Sangli , Kolhapur , Nagpur , Raigarh Nagpur , Thane , Pune, Mumbai
Districts (2011)	Nandurbar, Gadchiroli , Washim , Hingoli , Jalna , Latur , Dhule, Nanded	Beed, Parbhani, Buldana, Yavatmal, Gondiya, Amravati , Bhandara, Chanderpur	Ahmednagar, Akola, Wardha, Jalgaon, Aurangabad, Solapur, Ratnagiri, Satara	Sangli, Nasik, Sindhudurg, Raigarh, Kolhapur, Thane, Pune, Mumbai

between those two years of comparison.

##### **Exhibit 4.2.1a**

Change in districts over 10 years of performance

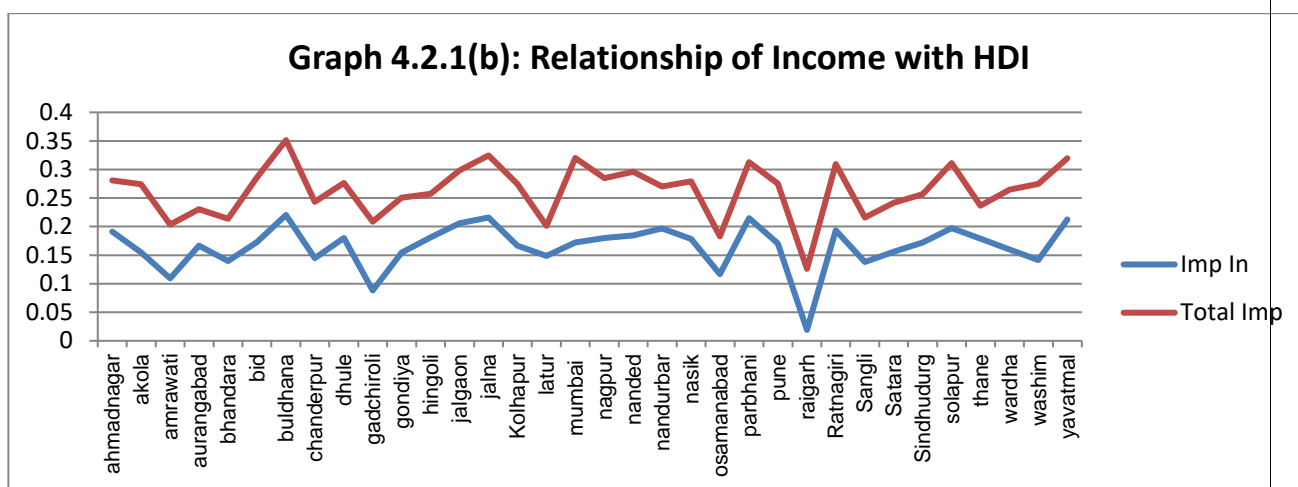

New low performing districts	Moved out of low performing districts
<ul style="list-style-type: none"><li>• Latur</li><li>• Osamanabad</li></ul>	<ul style="list-style-type: none"><li>• Buldhana</li><li>• Parbhani</li></ul>

The best performing district in terms of improvement in the indicators over 10 years on the HDI in Maharashtra is Buldana with 35% of growth with most contribution from income level that increased to 22% along with education and least contribution from health indicator that resulted a movement towards medium performing district. Parbhani also moved out of the low performing districts as its increase of 31 % ( 21% by income) and a negative growth in health indicator. Nasik, Raigarhand Thane having a good position and growth in income level sustain their place in top 10 performing districts even though their health and education indicator conclude vice versa.

Latur and Osmanabad have negative growth in health indicators which have a greater influence on the income and education together pushes them into low performing indicator.

It can be seen that HDI is influenced by income index of Maharashtra.

#### Correlation analysis of HDI with its components (Maharashtra)

Table 4.2.1b				
2001				
Index	Literacy	Infant Survival Rate	Income	HDI
Literacy	1.0000			
Infant Survival Rate	0.4301 (0.0111)	1.0000		
Income	0.6632 (0.0000)	0.5098 (0.0021)	1.0000	
<b>HDI</b>	<b>0.8181 (0.0000)</b>	<b>0.5719 (0.0004)</b>	<b>0.9708 (0.0000)</b>	<b>1.0000</b>
2011				
Literacy	1.000			
Infant Survival Rate	.3809 (0.0263)	1.000		
Income	0.550 (0.0006)	0.4943 (0.0030)	1.000	
<b>HDI</b>	<b>0.7537 (0.000)</b>	<b>0.5785 (0.0003)</b>	<b>0.9614 (0.0000)</b>	<b>1.000</b>

The coefficient of correlation has changed from the year 2001 to year 2011

- The Cof. Of Correlation for income is high for both 2001 and 2011 (.9708 - .9614) which has the maximum effect in HDI movement.
- The Cof of correlation for Literacy index has reduced by 6.4% and health influence in human development has remained fairly same

Income indicator correlation to the HDI is highest in both the years which by a large percentage from literacy and health showing the income has the most effect on the HDI value of the district in Maharashtra which can show an elevated or increased mean value and that may show a proxy display of overall development of the district.

Health has the least correlation value to the HDI. With income to health having approx. 50% of correlation and education to health 40% of correlation in Maharashtra

### **Karnataka**

The value of HDI is calculated taking the index value of education, health and income index available in the SHDR due to limitation of the data availability. The indices are not calculated from the indicator values. The districts are arranged into low, medium, high and very high performing districts.

<b>Table 4.2.2a: District wise ranking of Karnataka on human development index</b>				
	<b>Low</b>	<b>Medium</b>	<b>High</b>	<b>Very high</b>
<b>Districts 1991</b>	Raichur, Koppal, Gulbarga, Chamarajnagar, Bidar, Haveri	Kolar, Hassan, Gadag, Bellary, Mandya, Bagalkot, Bijapur	Davangere, Belgaum, Banglore rural, Dharawad, Tumkur, Chitradurga, Mysore	Dakshina Kannada, Udupi, Kodagu, Banglore, Shimoga, Uttar Kannada, Chikmalgur
<b>Districts 2001</b>	Bagalkot, Bijapur, Koppal, Chamarajnagar, Gulbarga, Raichur	Tumkur, Chitradurga, Kolar, Bellary, Mandaya, Haveri, Bidar,	Belgam, Chikmalgur, Dharawad, Hassan, Davangere, Gadag, Mysore	Banglore, Dakshina Kannada, Udupi, Kodagu, Shimoga, Banglore rural , Uttar Kannada

### Exhibit 4.2.2a

#### Change of districts in 10 Years

As seen in the list there is no much change the low performing districts of Karnataka

##### New addition to low performing districts

- Bagalkot
- Bijapur

##### Move out of low performing district

- Bidar
- **Haveri**

**Graph 4.2.2(a): Performance on HDI**

Highest improvement is seen in the district of Kolar of Karnataka with 41% improvement contributed by education and income status equally by 14% each. It is followed by Bangalore Urban (39%) with a sharp increase in the income level of the district (22%) which resulted in the 1<sup>st</sup> rank of the district from 4<sup>th</sup>. Bidar and Haveri have moved out of low performing districts by achieving a growth of 31% and 25% which are influenced by the education and income indicator.

Least improvement is seen in Uttar Kannada (17%) and Tumkur districts (18%) as they have no significant improvement in the education and health sector. Their income has increased by 14% but that has failed to generate the effect on human development.

When a graph is drawn between HDI improvement and education index improvement

#### Correlation analysis of HDI with its components (Karnataka)

Table 4.2.2b				
1991				
Index	Literacy	Life expectancy	Income	HDI
Literacy	1.0000			
Life expectancy	0.5049 (.007)	1.0000		
Income	0.7381 (0.0000)	0.4178 (0.030)	1.0000	
<b>HDI</b>	<b>0.9473 (0.0000)</b>	<b>0.6670 (0.0001)</b>	<b>0.8575 (0.0000)</b>	<b>1.0000</b>
2001				
Literacy	1.000			
Life expectancy	0.4147 (0.0263)	1.000		
Income	0.6679 (0.0006)	0.4973 (0.0030)	1.000	
<b>HDI</b>	<b>0.9274 (0.000)</b>	<b>0.6392 (0.0007)</b>	<b>0.8589 (0.0000)</b>	<b>1.000</b>

As seen in the graph as well as in the correlation there is higher weight age of education to other indicator when Karnataka is studied on the HDI parameters. With income and health been followed in this correlation.

**Key issues**

As it can be observed that different states employ different indicators for determination of health index the uniformity and comparative value of thus computed HDI for districts is questionable. Due to irregularity in selection of the health indicators across the selected states of HDI computation there is a need to identify the indicators for district level with no gaps and lack of information. For this study and to study the socioeconomic factor there is a requirement of uniformity among studied indicator.

As composite health index is calculated on the district basis and is uniform for all the districts in India Composite health index will be taken as the health index and will replace the existing health indicator n HDI methodology to generate result which are uniform and comparative. Taking the education and health index of Maharashtra and Karnataka as computed.

#### **4.3 Study of districts on Priority Index**

Five indices are used by the Human Development Reports to measure progress on human development. The first Human Development Report in 1990 introduced a new way of measuring development by combining indicators of life expectancy, educational attainment and income into a composite human development index, the HDI. The components are measured by four variables: GDP per capita, (PPP USD), literacy rates (%), combined gross enrollment ratio, (%) and life expectancy at birth (years).

The composite index results in a figure between 0 and 1, of which 1 indicates high level of human development and 0 being no level of human development. Countries are consequently given a specific rank dependent on their success in achieving HD, presented yearly in the Global HDRs.<sup>xiv</sup>

Ministry of Health and family welfare has formulated CHI as the index which represents the health of the district.

To study the influence of the socioeconomic indicators on the priority districts and the irregularity in health indicators among the states for calculation of Human development index for this exercise for setting priority districts we take up the economic and education indicator from the human development report and formulate a **Priority Index (PI)**. Having same methodology of index calculation there will be no issues in addition and comparability of data. PI is computed adding the value of pre-calculated CHI value for each district of the states and change in the districts ranking along with the correlation is studied.

### **Education and income index with CHI for Priority Index**

To study the effect of socioeconomic indicators onto the HPD (identified by composite health indicator) the education and income index calculated in district level HDI are summed up to to formulate a priority index for this study.

After computation of the PI the districts will ranked and categorized as the best and least performing districts. Then these are compared with the HPD identified by the Ministry of Health and Family Welfare and observed for change in the values and ranking of the district

## Ranking of districts on HPD and PI

### MAHARASHTRA (Table 4.2.3a)

The districts were ranked after calculation of Priority index of Maharashtra. They were ranked on the values calculated the highest to lowest attained value.

Top performing districts	
<u>High performing</u> <u>PI 2011</u>	<u>High performing</u> <u>(MoHFW 12)</u>
1. Pune	1. Pune
2. Mumbai	2. Mumbai
3. Kolhapur	3. Kolhapur
4. Raigarh	4. Satara
5. Nagpur	5. Solapur
6. Satara	6. Raigarh
7. Sindhudurg	7. Amrawati
8. Solapur	8. Gadchiroli
9. Chanderpur	9. Chanderpur

Low performing districts	
<u>PI 2011</u>	<u>HPD</u> <u>(MoHFW 12)</u>
26. Osamanabad	26. Aurangabad
27. Gadchiroli	27. Latur
28. Latur	28. Bid
29. Hingoli	29. Gondiya
30. Washim	30. Nanded
31. Jalgaon	31. Nandurbar
32. Parbhani	32. Thane
33. Nanded	33. Parbhani
34. Nandurbar	34. Jalgaon

Top performing districts	
<u>High performing</u> <u>PI 2011</u>	<u>High performing</u> <u>(MoHFW 07)</u>
1. Pune	1. Wardha
2. Nagpur	2. Nagpur
3. Wardha	3. Satara
4. Mumbai	4. Pune
5. Satara	5. Bhandara
6. Thane	6. Ahmadnagar
7. Kolhapur	7. Gondiya

34. Nandurbar	34. Nandurbar

<b>Table 4.2.3b</b>				
<b>Priority Index 2011</b>				
	<i>Education Index</i>	<i>CHI</i>	<i>Income index</i>	<i>PI</i>
Education Index	1.000			
<b>CHI</b>	0.3648 (.0338)	1.000		
Income index	0.5576 (0.0006)	0.2824 (0.1055)	1.000	
<b>PI</b>	<b>0.7155</b> <b>(0.000)</b>	<b>0.7600</b> <b>(0.000)</b>	<b>0.8146</b> <b>(0.000)</b>	<b>1.000</b>

The addition of socioeconomic indicator to the priority index present a noticeable change in the ranking of the districts that in relation change the districts in high and low performing. The correlation of each of the indicator has been fairly equal and the income correlation has decreased.

This has changed the ranking of the districts by 45% change in the districts in low performing or the districts which need the priority on all the three parameters namely education development, health development and standard of living development.

The reason for the change can be majorly because the earlier HDI was sensitive towards the change of income with a Coefficient of correlation [ $r=0.9614$   $p=0.000$ ].

This sensitivity was reduced when the composite health index was added to socioeconomic parameters referring to the fact that the development of health is an integral part of the human development.

#### KARNATAKA (Table 4.3.2a)

Karnataka districts were ranked as high and low performing districts after calculating the PI. The priority index was calculated and the districts were listed from highest and lowest ranking districts.

High performing districts		Low performing districts	
<u>High performing</u> <u>PI 2001</u>	<u>High performing</u> <u>(MoHFW- 2007)</u>	<u>Low performing</u> <u>Priority Index 2001</u>	<u>HPD</u> <u>(MoHFW 07)</u>
1. Bangalore	1. Mandya	21. Gadag	21. Gadag
2. Kodagu	2. Hassan	22. Bagalkot	22. Bijapur
3. Dakshina Kannada	3. Chikmagalur	23. Bijapur	23. Bagalkot
4. Chikmagalur	4. Mysore	24. Bellary	24. Bellary
5. Mandya	5. Kodagu	25. Koppal	25. Koppal
6. Hassan	6. Bangalore	26. Gulbarga	26. Gulbarga
7. Udupi	7. Bangalore Rural	27. Raichur	27. Raichur

	<i>Education Index</i>	<i>CHI</i>	<i>Income index</i>	<i>PI</i>
Education Index	1.000			
CHI	0.5583 (0.002)	1.000		
Income index	0.6679 (0.000)	0.4435 (0.0204)	1.000	
<b>PI</b>	<b>0.8128</b> <b>(0.000)</b>	<b>0.9247</b> <b>(0.000)</b>	<b>0.6879</b> <b>(0.000)</b>	<b>1.000</b>

A change in the ranking is seen in the best and low performing districts stating that there is an influence in the ranking of the districts. When the socioeconomic parameters are added to composite index the correlation of the health indicator with the PI increases with an effect to reduced correlation between education and income level to human development index.

There is no change observed in the list of low performing districts of Karnataka when socioeconomic parameters are added to health parameter to identify the high priority districts.

**There is a positive correlation between the health and education, health and income which makes it important to study the parameters along with health as they have a long term effect on the health condition of an individual.**

**Karnataka shows no change in the districts one of the reason can be the limitation of the recent data availability. Old data seldom reflect the recent picture of development in the region of Karnataka. Reasons for no change in the districts development need to be carried out that may include conducting a qualitative study to in order to find the factors influencing the districts.**

## **5. Discussion**

Both health and socioeconomic status (SES) have many dimensions and can be conceptualized and measured in multiple ways, with measurement often falling far short of the conceptual ideas. This adds to the complexity of synthesizing studies' results relating socioeconomic status, health, and race/ ethnicity. This study there was an attempt made to assess the influence of health determinants to health. The factors identified which influence the health of the community are divided into

### **The determinants of health include:**

- Social and economic environment,
- Physical environment, and
- Person's individual characteristics and behaviors.

SES is thus more than financial well-being as well the educational achievement, which are often used as indicators in empirical work; more broadly, it encompasses a lifetime of access to knowledge, resources, and opportunities. Taking these factors into consideration analysis was done by selecting two states and there socioeconomic indicators were added along with health indicators. While socioeconomic resources affect health throughout the lifecycle. With a strong positive correlation among the socioeconomic and health factors suggests that health cannot not be studied alone to set the priority for the development of the district. Major influencing factors need to be taken into consideration for the health development.

## **6. Conclusion**

A multitude of different social, economic and cultural factors determine a person's health. This means that people living in the same community, or people of the same age, can have vastly different chances of good health. Government of India employs Composite Health Index to identify the health high priority districts and these high priority districts receive 30% more health budget than other districts of the state. There is a need to revisit the criteria to identify the High Priority Districts of a state that will provide an over-all picture which would be helpful in equitable distribution of resources and will in return development of the district.

A strong correlation between health, education and income has previously also presented a note to act upon. A tool such as proposed priority Index will provide an overview of the health, education and income condition of the state and district. Further study on other states will provide clearer scenario of the effect of SES on health that may help to design an index with wider and complete vision

## Annexure

### Calculation of Composite health index
